**Do smart city projects  
make cities more  
sustainable?**

## Constructing the sustainable city: examining the role of sustainability in the 'smart city' discourse

Håvard Haarstad 

Department of Geography, University of Bergen, Bergen, Norway

### ABSTRACT

The idea of the 'smart city' is increasingly central to debates on urban development and sustainability, and a host of cities are now pursuing 'smartness' as a way to improve energy efficiency, transport, and public services. However, existing research does not provide a clear picture of how this smart city agenda actually contributes to sustainability. The social science literature has been critical toward urban smartness, with most of the empirical research focusing on the politics of data-driven and entrepreneurial urbanism. This article seeks to contribute to this debate by empirically examining the role that sustainability plays in the smart city discourse. Its distinctive approach is to investigate how urban smartness and sustainability are framed by an authoritative institution (the European Union) and then to trace these framings down to a particular city (Stavanger, Norway). The data show that the smartness approach is strongly tied to innovation, technology, and economic entrepreneurialism, and sustainability does not appear to be a very important motivating driver. Nevertheless, the 'sustainability component' of the smart city agenda becomes clearer the closer we come to the city level.

### ARTICLE HISTORY

### KEYWORDS

Smart city; sustainability;  
European Union; discourse;  
contextualization

### 1. Introduction

A predominant idea in the current discussions on urban sustainability is that of the 'smart city.' The promise of the smart city is to enable us to use energy in cities in more efficient ways, to make public transport more efficient and attractive, and to provide planners and decision-makers with data to allocate public resources more accurately (Townsend, 2014). The 'smartness' agenda is heavily promoted by the European Commission (EC); a European Parliament study found that more than half of European cities with over 100,000 inhabitants had implemented or proposed smart city initiatives (European Parliament, 2014).

However, the extent to which the smartness agenda contributes to urban sustainability is unclear. Much of the existing social science literature has been critical toward the idea that the smart city agenda has much to offer in terms of promoting sustainability, or resolving other societal challenges. It is often suggested that

**Table 1.** Overview of SCC-1 lighthouse project solutions as represented on the project websites.

Project/area	Energy	ICT and infrastructure	Mobility
Remourban	Develop monitoring tools to improve energy efficiency	Create city information platform combining multiple data sources, basis for operational and decision-making improvements	Use of electric or hybrid technologies for transport vehicles
	District scale retrofitting, adding new technologies to old districts to save energy	Shared smart grid and broadband infrastructure	Use charging infrastructure for electric and plug-in hybrid vehicles
	Renewable heating and cooling	Integrated smart grid	Door-to-door multimodality in urban transport
	Electricity, distributed generation	Optimized traffic flow from intelligent transport system	Enhance logistics supply chains (last mile delivery)
	Developing and using advanced building energy management system	Use real-time, multimodal data to improve transport customer experience	Use open data to improve urban transport and mobility services
Triangulum		Cloud-based peer-to-peer transport information	Incentive schemes to stimulate collective transport and cleaner vehicles
		City monitoring systems to build resilience against adverse effects	
	Install renewable energy plant in municipal buildings	Develop a generic gateway for 'smart home' video solutions	Smart charging of electric vehicles
	Develop infrastructure for energy generation, storage and use in heritage buildings	Smart home building automation, 100 'smart homes'	Procure and test three new battery-operated buses in real-life operation
	Establish open access marketplace for end-user and business applications	Develop cloud data hub for gathering and analyzing big data	Remove cars from major transport corridor to connect new modes of EV transport
	Transform previous industrial sites into smart districts	Develop IT-based tool to help residents access sustainable transport options	Introduce electric buses
GrowSmarter	Energy creation from cleaning contaminated land	Use IT-based instrument to model and visualize costs and yields of energy-efficient building renovations	
	Energy-efficient renovations in social housing stock	Integrated system monitoring and controlling street lighting, mobility, homes, offices	
	Smart building shell refurbishment	Smart street lighting	Sustainable delivery
	Smart building logistics	Waste heat recovery	Smart traffic management

Some think that municipalities pursue "smart city" policies. They don't! They pursue other policies - this bla-bla is how they justify them.

# To which degree do such smart initiatives push for environmental friendly solutions?

Field work in three EU Horizon 2020 Smart cities

- Nottingham
- Stockholm
- Stavanger

How are environmental concerns integrated into the “smart” solutions?

# Nottingham

# Smartness in Nottingham

- Image as hub for energy and transportation innovations
- Addressing energy poverty
- **Social sustainability**

## Why smart city project?

*« We are looking for the next steps. We know what we want to do, we haven't always got the funding for it, so we are actively looking for funding »*

*Informant in Nottingham*

# Stavanger

# Smartness in Stavanger

- Filling the void of the petroleum industry
- Innovation, absorb competence
- **Economic sustainability**

# Stockholm

# Smartness in Stockholm

- Maintain the qualities of the city as it was growing in size and population
- Livability and easy urban life
- **Social and environmental** sustainability

‘Smart city’ framing is a flexible ‘framing’ – can be filled with different types of content

Must fit with pre-existing priorities

Sustainability outcomes depend on active engagement (often by individuals)

Value comes from networks, EU funding ‘stamp of approval’
